Формирование отлетающего купола и кратера

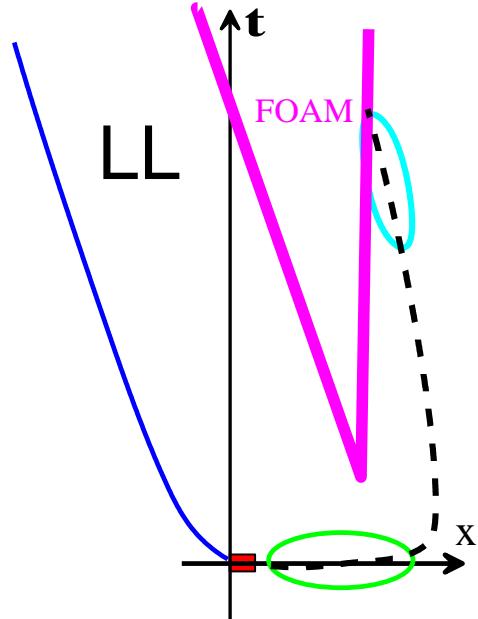

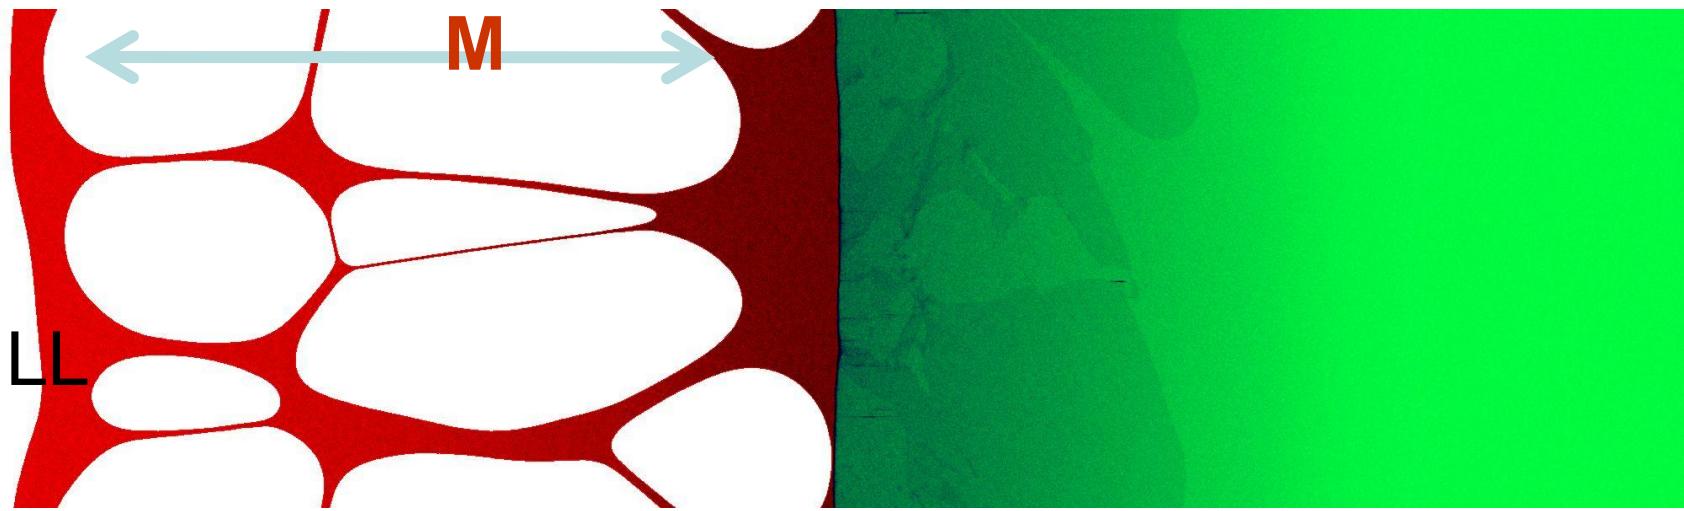

Формирование отлетающего купола и кратера

Dynamics of FOAM expansion and freezing process – competition between them

FOA

Red – liquid, Green – solid,

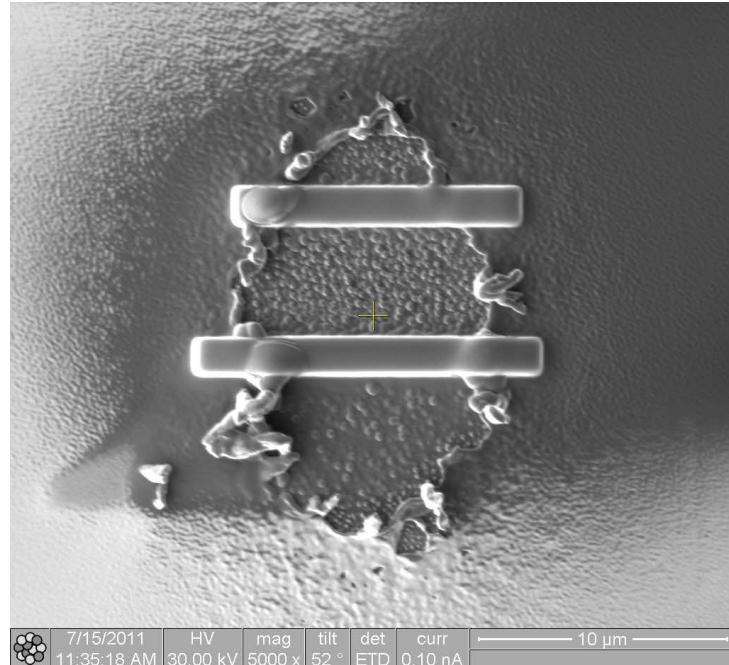

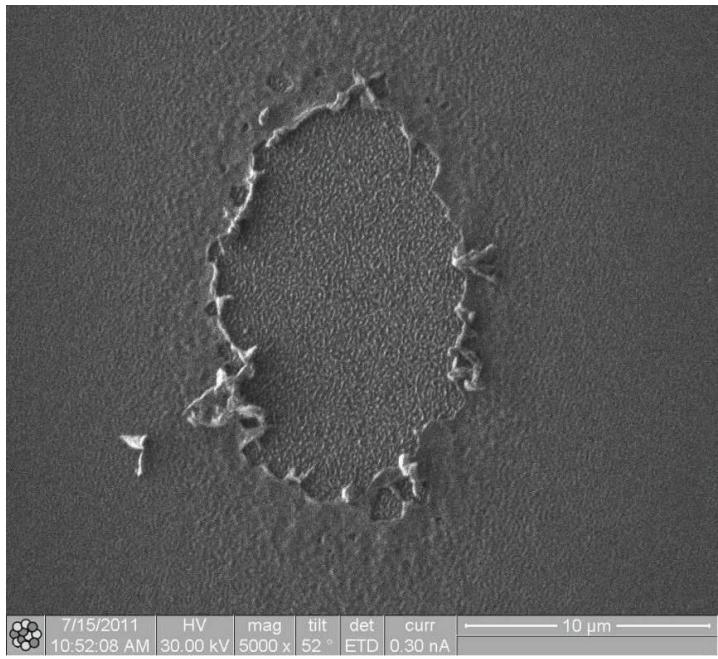

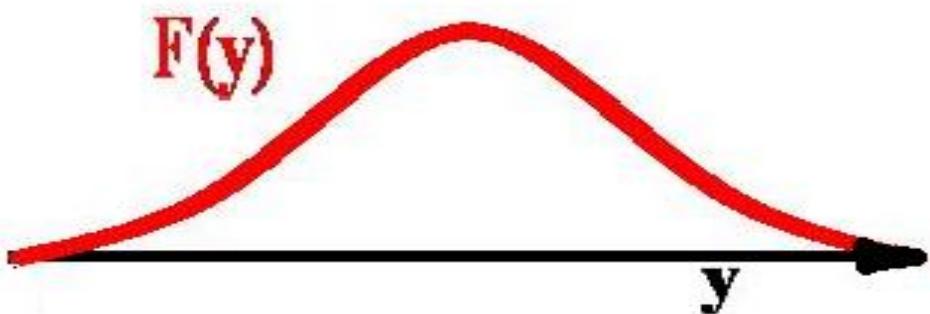

Al simulated by Zhakhovsky 2009 EAM

$F_{abs} = 120 \text{ mJ/cm}^2$, $\tau_L = 100 \text{ fs}$ - duration
time instant = 512 ps

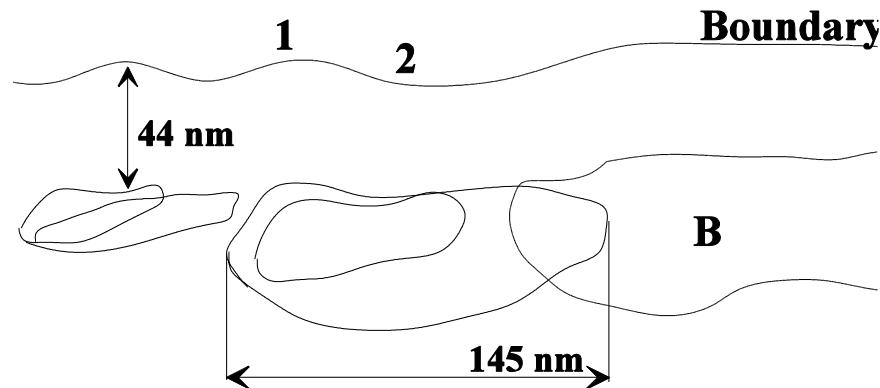

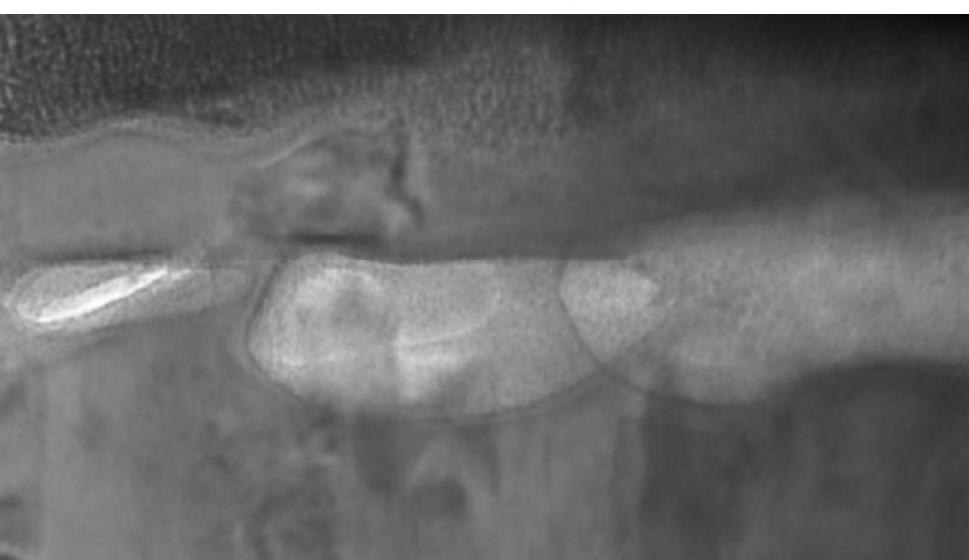

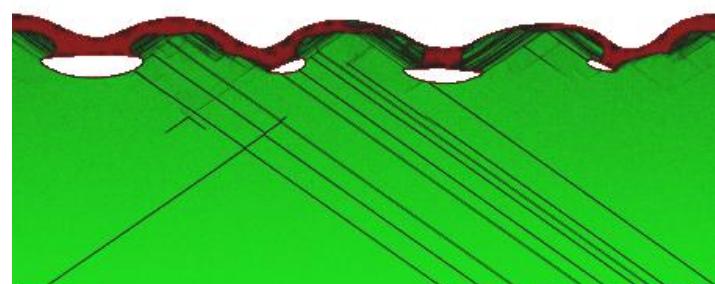

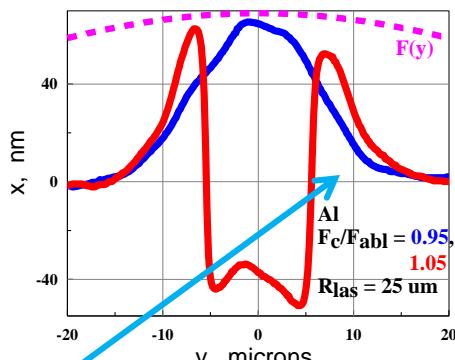

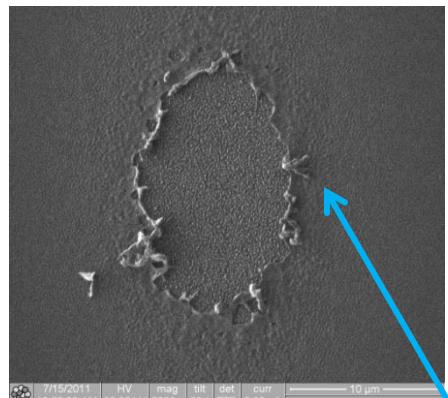

Huge MD sim.: lateral distance = 240 nm.

Crystallization front interacts with bottom of foam

Laser beam profile and crater profile

Huge residual deformations (swellings) and frozen nano-bubbles seen in exp & sim

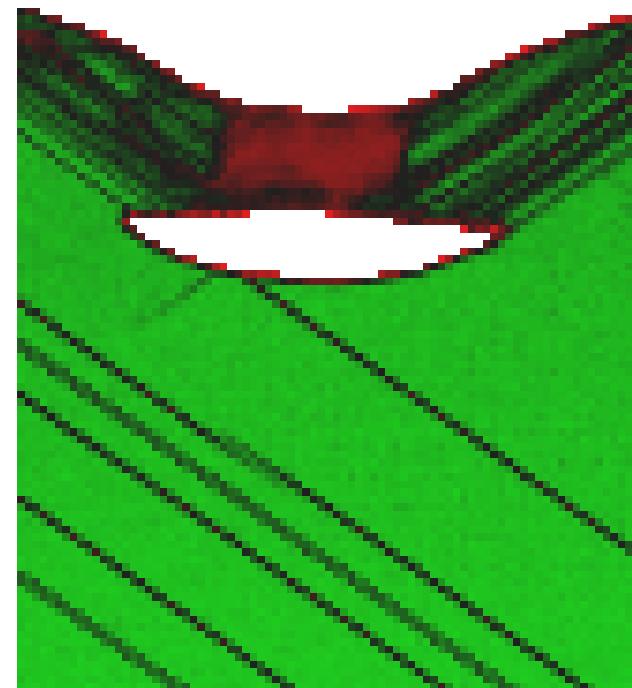

Diagnostics: Lamella FIB/TEM (Ashitkov et al., JETP Lett., 2012)

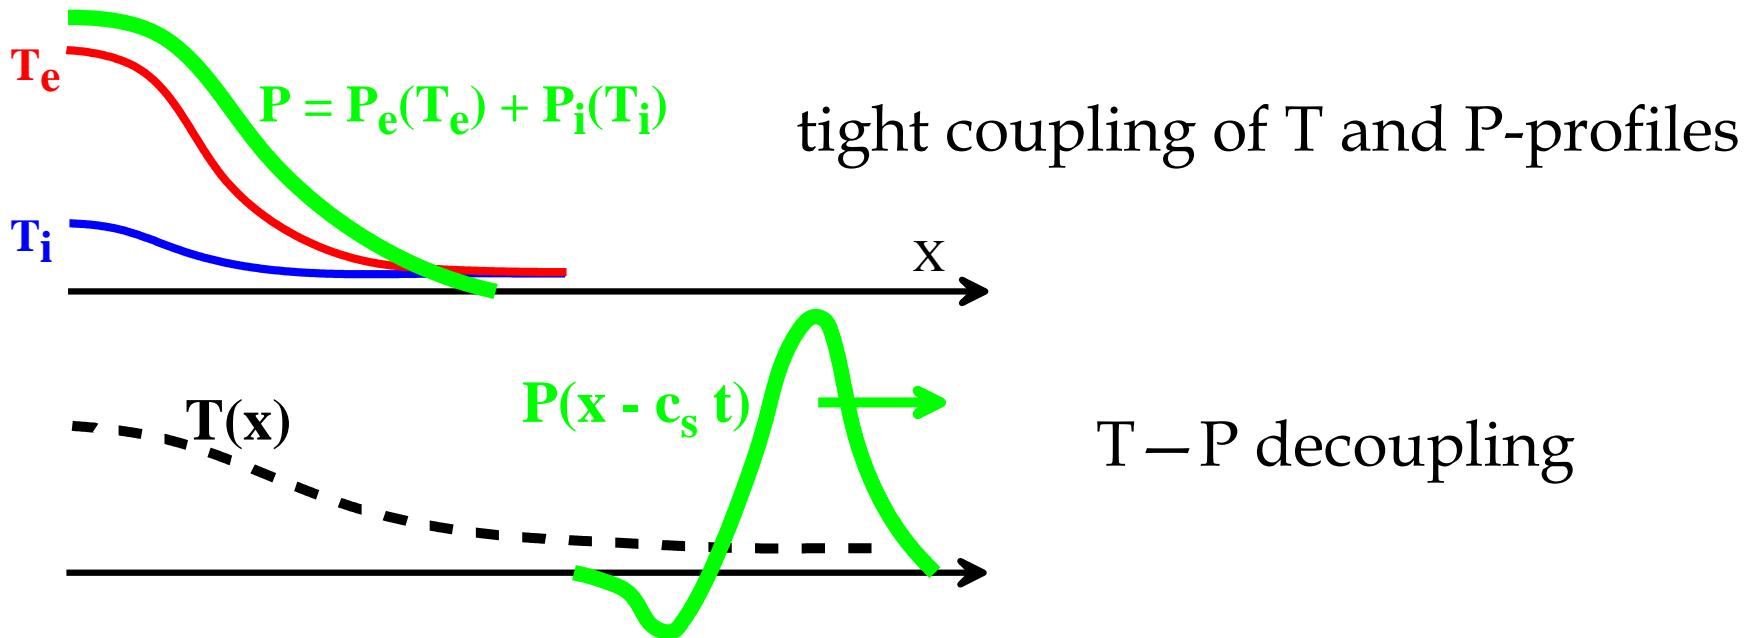

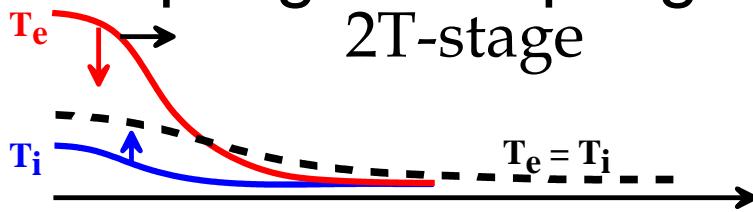

Large scale very long time MD sims. Spatial scales, depth under surface, shape of nano-bubbles, and shape of surface above them

Disk type (oblate spheroids) nano-bubbles, bubbles and surface above are in anti-phase → surface above bubble is not convex, it is concave !

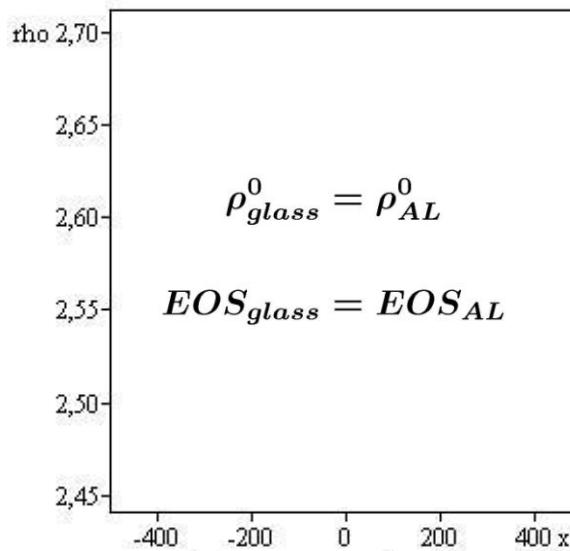

Exps and Sims

Thermal and dynamical phenomena - coupling/decoupling

- At the two-temperature state, pressure “immediately” follows T_e and T_i – tight coupling of P-profile to local internal energy
- While after relaxation T-profile remains “frozen” near surface but P-profile runs away with speed of sound (total decoupling)

$$S_{xx} = F_{Sol} S_1, \quad S_1 = \frac{4}{3} G \left(\frac{\partial x}{\partial x^0} - R_{rc} \right)$$
